1.1 Background and Necessity for the Website

Farmers markets play an important role in connecting communities with the growers who put fresh, seasonal food on their tables.

However, information on market locations and timings is scattered across flyers, community boards, social media, and word of mouth, with no single reliable source for residents in a

community or neighbourhood.

This makes it difficult for residents to plan visits around the market's actual operating day and hours, or to know in advance what product is likely to be available that week.

There is a clear requirement for a simple, accessible, browser-based tool that consolidates this information into one place, helping residents discover nearby markets and make the most of seasonal, local produce.

1.2 Proposed Solution

The proposed solution is to develop a Website called '**FreshFind**' that helps residents discover nearby farmers markets. The Website will be designed as a Single Page Application (SPA).

The Website should display market locations, operating days and hours, and the types of produce typically available at each market.

The platform should include an AI chatbot to answer frequently asked queries from visitors.

The Website should be built purely with HTML, CSS, and JavaScript, and related frontend technologies with no backend server.

All market and produce data should be presented using pre-populated JSON/text files or hardcoded data, and the chatbot would run on pre-scripted logic rather than a live external AI service.

This basic architecture keeps the platform lightweight, fast, and easy to deploy while providing a responsive and accessible experience across desktops, tablets, and mobile devices.

1.3 Purpose of the Document

The purpose of this document is to define the functional, non-functional, and technical requirements for the **FreshFind** Website, including its goals, scope, features, constraints, and user expectations.

This document describes the objectives and features of the Website, its user interfaces, the functions it is expected to perform, and the constraints under which it must operate.

It is intended to serve as a reference for both stakeholders and developers involved in designing, building, and maintaining the Website.

1.3.1 Who Can Use this Document?

Stakeholders (Technical and Non-Technical people associated with the project) and Developers of this portal.

Sample Site Map

Landing Page – This Page includes the following sections:

- ♣ **Core sections:** Find a Market, Market Directory, Produce Guide, Chatbot, Contact Us, About Us
 - Upon selecting a market from the directory, the respective market detail page should be displayed, showing its location, schedule, and

- Additionally, features such as Search/Find a Market, Bookmarks, and the chatbot are cross-page which means they remain accessible from each page.

It would be suitable for residents planning market visits, community organizations

promoting local farmers looking to expand their digital footprint and reach new customers.

1.5 Constraints

The Website should not have any facility to store information on a server.

Information can be fetched from JSON/TXT files and users can view the same being displayed; however, information cannot be written to the files from within the portal.

The chatbot should not connect to a live external AI service or backend; both should run on a static, pre-scripted dataset and rule-based

logic loaded from JSON files.

1.6 Functional Requirements

The portal would be designed as a responsive Website with a set of pages and menus that represent the choice of activities to be performed.

Pages, menus, and other visual elements must be designed in a visually appealing manner with attractive fonts, colors, and animations. All of these should also be laid out in a responsive manner.

Note: For several of these options, information would be retrieved from a pre-populated JSON file and displayed. (Hint: Use AngularJS directives, filters, services, controllers OR ReactJS components, modules, and other features to implement this.)

Menu and Web Page Functionality

Home Page

- ♣ **Display Elements:** Platform logo, heading, and introductory text.
- ♣ **Quick Find:** A prominent 'Find a Market Near You' search/filter prompt (by area, day of week, or produce type).
- ♣ **Highlights:** A featured/rotating showcase of nearby or currently open markets and this week's seasonal picks.
- ♣ **Chatbot Launcher:** A floating chatbot icon accessible from the home page and all subsequent pages.

Upon selecting a market or applying a filter, the respective results should be displayed dynamically.

Market Directory

- ♣ **Functionality:** Displays a catalog of farmers markets loaded from JSON files.
- ♣ **Each market card includes:** Market name, area/location, operating days and hours, a short description, and a thumbnail image.
- ♣ **Filtering:** Filterable by area/neighborhood, day of the week, and produce type available.
- ♣ **Sorting:** Sortable alphabetically, by proximity (if location is provided), or by next open day.

Market Detail Page

- ♣ **Location Details:** Address, area/neighborhood, and an embedded Google map showing the market location.
- ♣ **Schedule:** Operating days and hours, clearly displayed (for example, as a weekly schedule table).
- ♣ **Product Available:** A list or grid of items typically available at this market, with icons/images.

Produce Guide

- ♣ **Functionality:** A browsable catalogue of product types, each with a description, typical season, and the markets where it can be found.
- ♣ **Filtering:** Filterable by product category (fruits, vegetables, herbs, dairy, and so on).
- ♣ **Data Source:** Loaded from a pre-populated JSON file linking produce items to markets and seasons.

AI Chatbot

- ♣ **Functionality:** A floating chatbot widget available across the site that helps visitors find answers to common queries.
- ♣ **Data Source:** Chatbot responses are generated from a static, pre-scripted dataset of questions, answers, no live external AI service or backend is used.
- ♣ **Interaction:** Visitors can type a question or select from suggested quick reply to prompts; the chatbot responds and links to the relevant market or produce page.

Content Bookmarking System

For all content types, the following should be available:

- ♣ Favorite markets and product guide entries
- ♣ Personal notes attached to bookmarked content (session-only)
- ♣ Export bookmarks as a formatted list
- ♣ Share recommendations via social links

Note: You can implement this using a combination of various frontend technologies.

✉ Contact Us

This page includes static contact information, with a map showing live location. (Hint: Use Google Maps and Geolocation feature)

🦉 About Us

This page includes static information about the team and the platform.

🔑 User Interface Features

- ♣ **Visitor Counter:** Simulated visitor counter using JavaScript.
- ♣ **Real-Time Clock:** A real-time clock and browser geolocation should be used to highlight markets open 'right now' where applicable.
- ♣ **Hover Effects:** Hover effects and animated transitions for an interactive feel.
- ♣ **Breadcrumb Navigation:** Breadcrumb navigation for better UX across directory and detail pages.
- ♣ **Dummy Login/Signup:** Non-functional login/signup buttons included for design continuity.

Use Google Lighthouse a free tool to test and validate your Website's performance, accessibility, and SEO.

Important Note Regarding AI Usage:

You are encouraged to use AI-powered tools (such as AI-assisted Website builders, UI/UX design tools, code assistants, and image-generation tools) to enhance productivity and creativity. However, AI should be used as a supporting aid rather than a substitute for your own design, development, and problem-solving skills.

Do NOT rely on full boilerplate or completely ready-made Website templates for your project, as this will adversely affect your evaluation. Your Website's design, structure, and implementation should primarily reflect your own skills and understanding.

Do NOT submit AI-generated code or content without meaningful modification and understanding. AI-generated suggestions may be used for guidance, learning, debugging, or improving productivity, but the final solution should demonstrate your own effort, logic, and implementation.

AI-generated images and graphics are permitted for visual elements of your Website.

Acknowledge the AI tools used (for example, Canva AI, Figma AI, Uizard, or similar) in your project documentation or submission.

During evaluation, judges may ask participants to explain their design decisions, implementation approach, and code. You are therefore expected to understand and be able to justify all aspects of their submitted work.

1.7 Non-Functional Requirements

There are several non-functional requirements that should be fulfilled by the Website. The Website should be:

- ♣ **Safe to use:** The Website should not result in any malicious downloads or unnecessary file downloads.
- ♣ **Accessible:** The Website should be usable by people with visual, hearing, or motor impairments, through sufficient contrast, legible text, and keyboard/screen-reader support.
- ♣ **User-friendly:** The Website should be quick and intuitive to use, with a clear layout and logical navigation.
- ♣ **Operability:** The Website should operate in a reliably efficient manner.

- ♣ **Performance:** The Website should demonstrate a high value of performance through speed and throughput — it should be fast to load, and page redirection should be smooth.
- ♣ **Capacity:** The Website should support a large number of users.
- ♣ **Availability:** The Website should be available 24/7 with minimum downtime.
- ♣ **Compatibility:** The Website should be compatible with the latest browsers.

These are the bare minimum expectations from the project. It is a must to implement the functional and non-functional requirements given in this SRS. Once they are complete, you can use your own creativity and imagination to add more features if required.

1.8 Interface Requirements

Technology Stack

Hardware

- ♣ Intel Core i5/i7 Processor or higher
- ♣ 8 GB RAM or higher
- ♣ Color SVGA
- ♣ 500 GB Hard Disk space
- ♣ Mouse
- ♣ Keyboard

Software

- ♣ **IDE:** Visual Studio Code, Free Coffee Cup HTML5 Editor, Notepad++, or any other HTML5 editor.
- ♣ **Frontend:** HTML5, CSS3, JavaScript, jQuery, Bootstrap, Angular or ReactJS, XML, and the Figma UI Toolkit.
 - **AI and Development Tools:** Figma AI, Canva Magic, Framer AI, Uizard, Visily AI, Penpot, GitHub Copilot, Tabnine, Windsurf, and ChatGPT, Claude, or Gemini for UI design, code assistance, image generation, and FAQ/content generation.
 - **Chatbot Platforms:** Tawk.to and Tidio for chatbot integration.
- ♣ **Data Store:** JSON files or TXT files

1.9 Project Deliverables

You must design and build the project and submit it along with a complete project report that includes:

- ♣ Problem Definition
- ♣ Design specifications
- ♣ Diagrams such as flowcharts for various activities, Data Flow Diagrams, and so on
- ♣ Test Data Used in the Project
- ♣ Project Installation Instructions (Mandatory)

Documentation is considered a very important part of the project. Ensure that documentation is complete and comprehensive.

Documentation should not contain any source code. The consolidated project should be submitted as a Source Code zip file with a ReadMe.doc file listing assumptions (if any) made.

Submit a video (.mp4 file) demonstrating the working of the Website including all the functionalities of the project. This is MANDATORY.

Optionally, a live hosted URL can be supplied for the site. Over and above the given specifications, you can apply your creativity and logic to improve the portal.
